Project Description

Health++ is an online clinic management system to help beauty clinics and medical laboratories manage their client information. This system connects clients directly to the best-reviewed doctors and allows immediate appointment booking and cancellation. Health++ promotes the incorporation of technology into the health field from the client's perspective to improve communication with the clinic. The patient can track his medical data after undergoing testing, making the process easier for them. The patient's medical history will also be completely accessible to the doctor, along with a copy of any required test results. The client will be shown by Health++ all the clinics and laboratories where the test is offered along with the associated fees. Because everything is digitized, this low-cost, to develop, and web-app system will be a great way to manage documentation of the health centers while benefiting the surrounding environment in several ways.

Project Significance and Goal

Upgraded technological capability will be required for the clinic to be able to track all medical reports and receive fast responses, and reservations. Customers demand a simple and easy way by which to book appointments and it is imperative that all information is saved in a secure manner. While Health++ maintains a website with tests lists and descriptions for each clinic separately, it does not currently allow payment to be done online. This functionality might be integrated in the future to enhance our product more. Additionally, new online marketing functionality must be considered to target existing and potential customers through methods such as e-mailing lists, promotional advertisements, and loyalty discounts.
